

This command is used to construct an IMKPinching material. This material simulates the modified Ibarra-Medina-Krawinkler deterioration model with pinching hysteretic response (Ibarra et al. 2005; Lignos and Krawinkler 2011).

**Command Syntax:**

**uniaxialMaterial IMKPinching** \$Mat\_Tag \$Ke \$Up\_pos \$Upc\_pos \$Uu\_pos \$Fy\_pos \$FmaxFy\_pos \$FresFy\_pos \$Up\_neg \$Upc\_neg \$Uu\_neg \$Fy\_neg \$FmaxFy\_neg \$FresFy\_neg \$Lamda\_S \$Lamda\_C \$Lamda\_A \$Lamda\_K \$c\_S \$c\_C \$c\_A \$c\_K \$D\_pos \$D\_neg \$kappaF \$kappaD

**Model Parameters Definitions:**

\$Mat_Tag	Integer identifying the material
\$Ke	Elastic stiffness
\$Up_pos	Pre-capping deformation in positive loading direction
\$Upc_pos	Post-capping deformation in positive loading direction
\$Uu_pos	Ultimate deformation in positive loading direction
\$Fy_pos	Yield strength in positive loading direction
\$FmaxFy_pos	Maximum-to-yield strength ratio in positive loading direction
\$FresFy_pos	Residual-to-yield strength ratio in positive loading direction
\$Up_neg	Pre-capping deformation in negative loading direction
\$Upc_neg	Post-capping deformation in negative loading direction
\$Uu_neg	Ultimate deformation in negative loading direction
\$Fy_neg	Yield strength in negative loading direction
\$FmaxFy_neg	Maximum-to-yield strength ratio in negative loading direction
\$FresFy_neg	Residual-to-yield strength ratio in negative loading direction
\$Lamda_S	Cyclic deterioration parameter for yield strength deterioration
\$Lamda_C	Cyclic deterioration parameter for post-capping stiffness deterioration
\$Lamda_A	Cyclic deterioration parameter for accelerated reloading stiffness deterioration
\$Lamda_K	Cyclic deterioration parameter for unloading stiffness deterioration
\$c_S	Rate of yield strength deterioration
\$c_C	Rate of post-capping stiffness deterioration
\$c_A	Rate of accelerated reloading stiffness deterioration
\$c_K	Rate of unloading stiffness deterioration

$\$D_{pos}$	rate of cyclic deterioration in the positive loading direction (this parameter is used to create asymmetric hysteretic behavior for the case of a composite beam). For symmetric hysteretic response use 1.0.
$\$D_{neg}$	rate of cyclic deterioration in the negative loading direction (this parameter is used to create asymmetric hysteretic behavior for the case of a composite beam). For symmetric hysteretic response use 1.0.
$\$kappa_F$	Pinching parameter defining the break point with respect to the maximum force experienced in the direction of loading ( $0 < \kappa_F < 1$ ).
$\$kappa_D$	Pinching parameter defining the break point with respect to the maximum permanent deformation experienced in the direction of loading ( $0 < \kappa_D < 1$ ).

**NOTE: All material model parameters in the negative direction should be specified in positive values.**

#### **Validation with II-DAP:**
